ABSTRACT

The purpose of the test was to investigate the nature of the Orbiter boundary layer characteristics at angles of attack from -4 to 32 degrees at a Mach number of 4.6.

The effect of large grit, employed as transition strips, on both the nature of the boundary layer and the force and moment characteristics were investigated along with the effects of large negative elevon deflection on lee side separation. In addition, laminar and turbulent boundary layer separation phenomena which could cause asymmetric flow separation were investigated.

INTRODUCTION

This report presents the results obtained during a program conducted on an 0.015-scale model of the SSV Orbiter Configuration 140A/B to study the nature of the upper-wing-surface boundary layer and to measure the static aerodynamic characteristics at a Mach number of 4.6. These tests were performed in the Vought Systems Division (VSD) High Speed Wind Tunnel from September 30 until October 2, 1974. This program was preceded by a feasibility test regarding the use of thin-film heat flux gages as a method of defining boundary layer characteristics - reported in Reference 1..

This report presents the results of the force testing.

V_7	Vertical tail
W_{107}	Wing

INSTRUMENTATION

The 0.015 scale SSV Orbiter Configuration 140A/B model, equipped with eight Thermo-Systems Inc. Model 1268 Flush Surface thin-film heat-flux gages, and all readout and recording equipment associated with the heat-flux gages, were supplied by the customer. The same model was used for both the boundary layer study (heat-flux gage test) and the force test.

The aerodynamic forces were measured in six components with the VB-36 balance, an internal strain gage instrument. Model base and cavity pressures were measured with 50-psi Stratham absolute pressure transducer. These transducers were located on the model cart and were connected to tubes which were routed along the sting to the measurement site. Instrumentation was also provided to measure the required flow properties and the model cart angle of attack.

TEST FACILITY DESCRIPTION

The Vought Aeronautics Company High Speed Wind Tunnel is an atmospheric exhaust, blow down tunnel with a 4 foot by 4 foot test section size. The Mach number range of the tunnel is from 0.5 to 5.0. Air is stored in six tanks, with a total volume of twenty-eight thousand cubic feet, at a maximum pressure of 600 psia and a nominal temperature of 100 degrees Fahrenheit.

The circuit utilizes both supersonic and transonic test sections, each 4 foot by 4 foot in cross section and slightly over five feet long. For supersonic operation a single-peak variable diffuser is placed downstream of the supersonic test section. For transonic operation the variable diffuser is removed from the circuit and replaced with a porous wall transonic test section with 22 percent wall porosity. The transonic plenum is pumped by ejector action of the main tunnel airstream acting on controllable ejector flaps located downstream of the test section. Adjustable choking flaps, also located downstream of the test region, are utilized for subsonic Mach number adjustment.

A more complete description is found in Reference 2.

TEST PROCEDURES

Preparations for the force program began with the pre-test calibration of the VB-36 balance. After the heat-flux test program the gage cables were removed from the model, the balance was installed, and load-deflection constants were determined for the sting-balance combination.

Check loads were applied to assure that the balance and data acquisition system were functioning properly. Base and cavity pressure tubing was installed and these transducers were calibrated.

During the force runs the tunnel was started with the model at $\alpha=0$ and after flow was established, data sampling at a rate of 10 per second was begun and the model was pitched at a pre-selected rate to the maximum α . Data sampling was most often continued as the model was pitched down at a different rate to $\alpha=0$ where data acquisition was terminated and the tunnel shut down. During the course of the force test program, different pitch rates were employed with the several model configurations, in an effort to uncover discontinuities or substantial hysteresis. Further, four runs (Nos. 61-64) were made with an unsymmetrical configuration and with the model rolled on the sting so that combined pitch and yaw rates would be imposed on the model.

Immediately after a run, the data were reduced using the on-site IBM 1800 Data Acquisition and Reduction System and, during the force test, selected coefficients were displayed on the automatic plotters.

DATA REDUCTION

The data reduction was performed on-site using the IBM 1800 digital computer. During the heat-flux program, only the tunnel flow conditions and the rms meter output were reduced. During the force test, aerodynamic coefficients in six components were computed according to the procedures described in Reference 3.

The pre-test calibration of the VB-36 balance provided standard deviations of the six balance components. These values were used with an arbitrary $q = 1500$ psf, to compute the following estimates of "worst-case" coefficient deviations, which result from the balance:

<u>Coefficient</u>	<u>Deviation</u>
C_N	± 0.0011
C_m	± 0.0005
C_Y	± 0.0005
C_n	± 0.0012
C_l	± 0.00006
C_A	± 0.00008

In order to provide some means to determine overall accuracy, the following estimations, based on past experience and calibrations, summarize the maximum error associated with the three items:

Dynamic Pressure	$\pm 0.5\%$
Mach Number	$\pm 1.0\%$
Digital Data System	$\pm 0.1\%$

Model data were converted to standard NASA coefficients using the following constants:

Reference Area	$S_{REF} = 0.6053 \text{ ft}^2$
Span	$b_{REF} = 14.0502 \text{ in.}$
Mean Aerodynamic Chord	$L_{REF} = 7.122 \text{ in.}$
Cavity Area	$S_c = 0.03409 \text{ ft}^2$
Base Area	$S_B = 0.0615 \text{ ft}^2$
Moment Reference Center	M.S. 16.147, 0.375 in. below fuselage reference line.

MODEL COMPONENT : OMS POD - M₆

GENERAL DESCRIPTION : Basic configuration 3A OMS pods with nonmetric
RCS engine housing and nozzles.

MODEL SCALE: 0.015

DRAWING NUMBER: VL70-000139B

DIMENSIONS :	FULL SCALE	MODEL SCALE
Length	<u>346.0</u>	<u>5.190</u>
Max Width	<u>108.0</u>	<u>1.620</u>
Max Depth	<u>113.0</u>	<u>1.695</u>
Fineness Ratio	<u> </u>	<u> </u>
Area	<u> </u>	<u> </u>
Max. Cross-Sectional	<u> </u>	<u> </u>
Planform	<u> </u>	<u> </u>
Wetted	<u> </u>	<u> </u>
Base	<u> </u>	<u> </u>
Station of aft end of RCS nozzle block	<u>1560.0</u>	<u>23.400</u>

TABLE III (Cont'd)

MODEL COMPONENT : RUDDER - R₅GENERAL DESCRIPTION : Configuration 140C orbiter rudder (identical to configuration 140A/B rudder).MODEL SCALE: 0.015DRAWING NUMBER VL70-000146B, VL70-000095

DIMENSIONS	FULL SCALE	MODEL SCALE
Area - Ft ²	<u>100.15</u>	<u>0.023</u>
Span (equivalent), In.	<u>201.0</u>	<u>3.015</u>
Inb'd equivalent chord, In.	<u>91.585</u>	<u>1.374</u>
